

# FORTIFYING AGAINST NEXT GENERATION IT CYBER ATTACKS

**In an ever-advancing IT landscape where cybercrime continues to get more sophisticated, protecting, monitoring and proactively responding to threats and activity has never been more important.**

There are numerous endpoint protection platforms (AV/EDR/MDR/XDR) on the market today, with feature sets and functionality across them that is comparable in many ways. We understand that a successful solution goes well beyond the acronyms and technology used, and is a direct result of proper planning, implementation and continuous improvement of that technology that is in tune with emerging threats.

## **Discover Managed EDR**

Konica Minolta's Managed Endpoint Detection & Response (MEDR) service, powered by SentinelOne, is designed to protect supported endpoints, and respond to neutralize possible threats before they can compromise your operations. Doing much more than your standard behavior-based antiviruses and unmanaged endpoint detection services, MEDR is a fully managed security service that works 24/7 to give you the most effective protection against modern threats.

## **MEDR vs EDR Solutions**

Having a great solution deployed and poorly managed provides no benefit to your organization. MEDR offers the benefits of an EDR Solution, such as behavior-based protection, total visibility into activity on endpoints, plus the ability to go back in time to see what happened, plus a fully managed security service that is delivered by a team of dedicated cybersecurity experts.

This gives you full coverage including:

- EDR Solution Deployment
- Deployment Gap Visibility
- Policy Configuration, Tuning, and Exceptions
- Proactive Threat Hunting
- 24x7x365 Monitoring and Response
- Reporting
- Incident Response Assistance
